"Clarification"/"Disclaimer"

Please do not confuse "INTERNET" with the "WEB (ver. ?)",

since I am going to talk about the (Future)
Internetworking

NOT

about the Future of the Web (wheter it be 2.0, 3.0, ...) or Services evolution etc.

© Ericsson AB 2007 Raimo Vuopionperä 4 Future Internet(working) December 2007

My CV

Younger me →

Education

- Enontekiön lukio 1986
- M.Sc. in Theoretical Physics, Univ. of Helsinki 1992
- Ph.D. in Theoretical Particle Physics, Univ of Hel.

Other

- Born (1.4.1967) in Finnish Lapland
 - Mother Norwegian, Father Finnish

Misc. (e.g. hobbies, etc.)

- Reading SciFi & Fantasy!
- Following Motorsports (especially DragRacing :-)
- Cooking (somewhat)
- Family (2 kids)

Career

- 1989, Research trainee
 - Worked 1 month at CERN (Geneva)
- 1990 Worked 4 months at CERN (Geneva).
- 1991 Military Service (Vänrikki)
- 1992 Worked 2 months at CERN
- 1994 Worked 6 Months at DESY (Hamburg).
 - Otherwise (e.g. while studying) I worked as research assistant at department of Physics at the University of Helsinki.
 - Have also appeared (interviewed at science programs) @ National Radio and TV programs.
- Summer 1996 Dec 1997, worked as Post doc. At CERN.
 - Lived actually in France (St. Genis P.).
- 1st of March 1998 joined Ericsson as a "Internet Researcher".
- Fall 1998 section manager at NomadicLab.
- May 1st 1999 -> NomadicLab Research Manager.

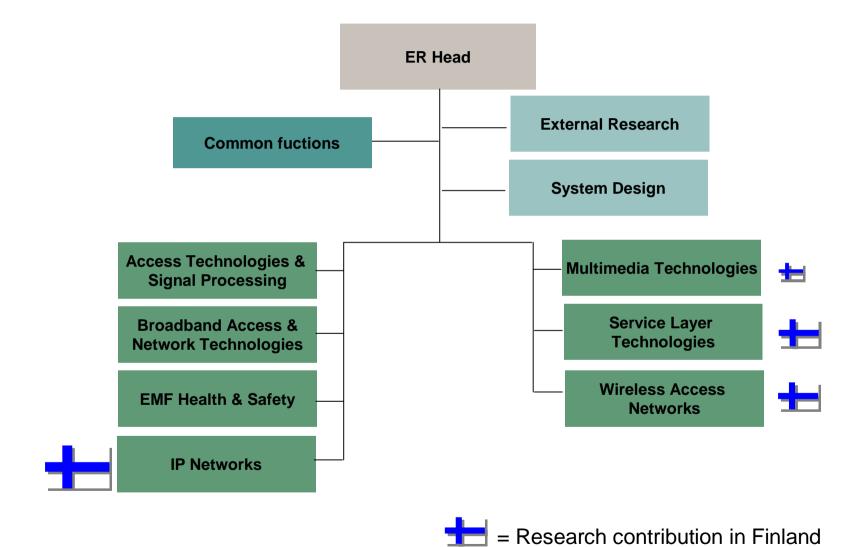

© Ericsson AB 2007 Raimo Vuopionperä 5 Future Internet(working) December 2007

NomadicLab

- Ericsson Research (IP Networks, Wireless Access Networks and Service Layer Technologies) Representative @ E/// Finland!
 - Belongs to Oy L M Ericsson Ab (LMF) Telecom
 R&D organization.
 - HEADCOUNT: 47 researchers working on various projects.
- Presently 5 main research areas:
 - (IP) Networking Architecture
 - (IP) Networking Security
 - (IP) Multimedia

© Ericsson AB 2007 Raimo Vuopionperä 6 Future Internet(working)

Ericsson Research

© Ericsson AB 2007 Raimo Vuopionperä 7 Future Internet(working) December 2007

NomadicLab...

- Big Part of our research results are contributed to standardization forums or are published either in conferences or scientific journals!
 - In addition to that we are actively participating to prototyping effort that aim at introducing the new features to wireless systems.
 - BUT ... We also patent our ideas [>>1 patent/person/year]
- Active participation both to Nation wide (e.g. with Universities & Local companies) and to EU wide research collaboration projects.
 - We are also cooperating directly with external companies/universities!
 - Some visiting external researcher have worked at NomadicLab (Possibility also in the future ©)
- Participation to international standardization forums (mainly IETF and 3GPP) is also one of the main goals of the Nomadiclab operations.
 - ~>70 RFC's (inc. RFC Queue; ~< 50% Finnish RFC'"s).
 - Leading positions (i.e. many IETF/IRTF WG Chairs) at the IETF, including (only 2006 main achievements listed)
 - Jari Arkko nominated to Internet Area Director (@ IESG).
 - Gonzalo Camarillo nominated 3GPP liasion for IETF.

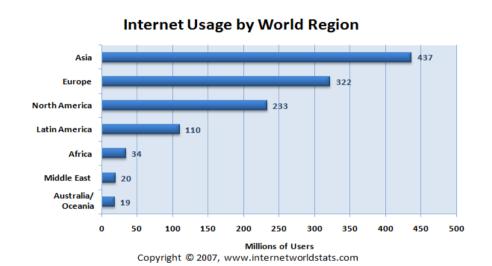

© Ericsson AB 2007 Raimo Vuopionperä 8 Future Internet(working) December 2007

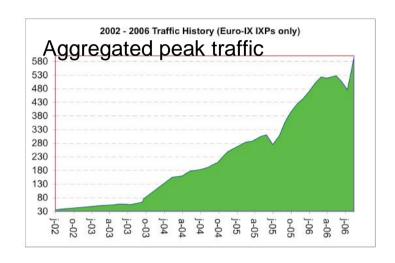

Background/History

The Success of Internet also its failure?

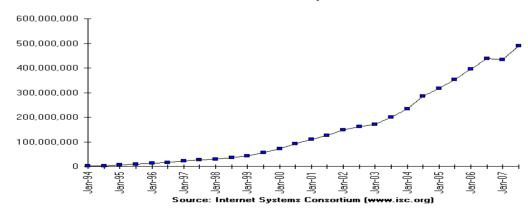

© Ericsson AB 2007 Raimo Vuopionperä 9 Future Internet(working) December 2007

Tremendous success

Internet Domain Survey Host Count

Source: European Internet Exchange Association 2006 Report on European IXPs 10 December 2007

Impacts all communication and content businesses

New services driven by Internet

- Global reach with 1 billion potential users
- Superior value for consumers and businesses
- World wide innovation community

New business models driven by Internet

- 1. Obtain big subscriber base with "free" service
- 2. Monetize with different business models

Broadband usage driven by Internet

- Services independent from access
- Exponential demand for network capacity
- Significant growth in network connectivity

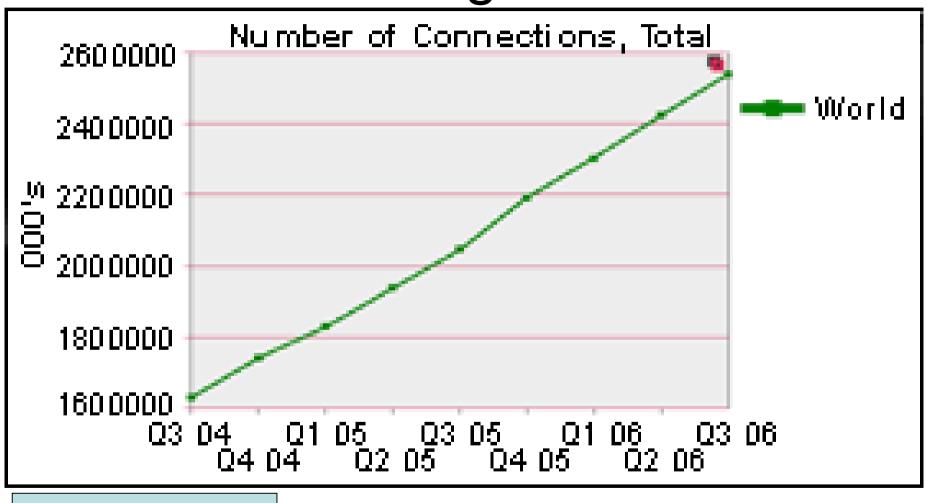

© Ericsson AB 2007 Raimo Vuopionperä 11 Future Internet(working) December 2007

Tremendous success, so where is the problem?

- Internet has grown out of its original design scope (Originally defined by US Military)
- The original design assumptions do not meet the current realities. Some examples:
 - End users are not as the used to be:
 - Mutual trusting and co-operating community challenged by selfish behavior: security threats, SPAM, malware, unsolicited ads
 - Retrieval and unicast communication evolving into social networking
 - Hosts are not as they used to:
 - Desk top hosts vs. multi-interface and mobile hosts
 - Huge variability of link layer characteristics:
 - from WLAN to satellite and 10s of G/bits Ethernet
 - End to end design principle vs. firewalls, NATs

© Ericsson AB 2007 Raimo Vuopionperä 12 Future Internet(working) December 2007

Mobile growth

Source GSMA

GSM/UMTS 2.4 bill 1Q 07

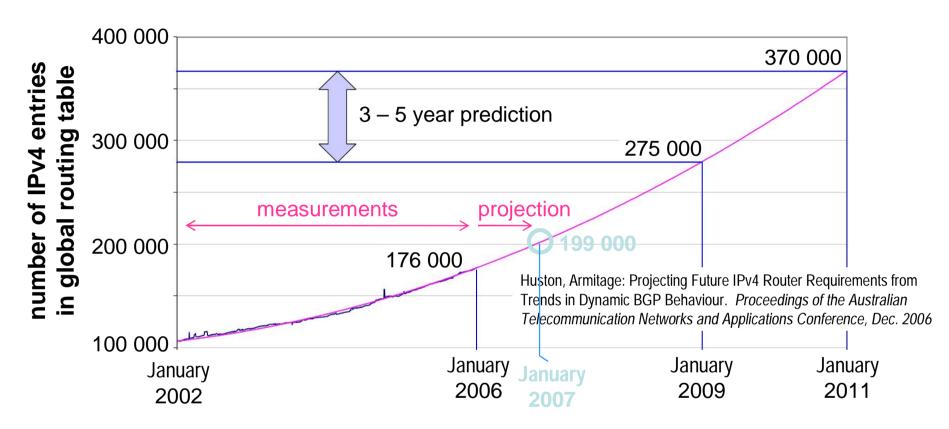

© Ericsson AB 2007 Raimo Vuopionperä 13 Future Internet(working) December 2007

Tremendous success, so where is the problem? (cont.)

- Popularity of the overlay network applications is a testimony of missing functionality
- Cost of success => scalability problems
 - Routing table growth
 - More expensive core routers (CAPEX)
 - Address space exhausting
 - More middleboxes and management (OPEX)
 - Complexity into to application design to detect the middleboxes (slower innovation, looming stagnation)
 - DNS overloading
 - Used for service discovery, public key distribution, etc
 - Additional dependency in service deployments

© Ericsson AB 2007 Raimo Vuopionperä 14 Future Internet(working) December 2007

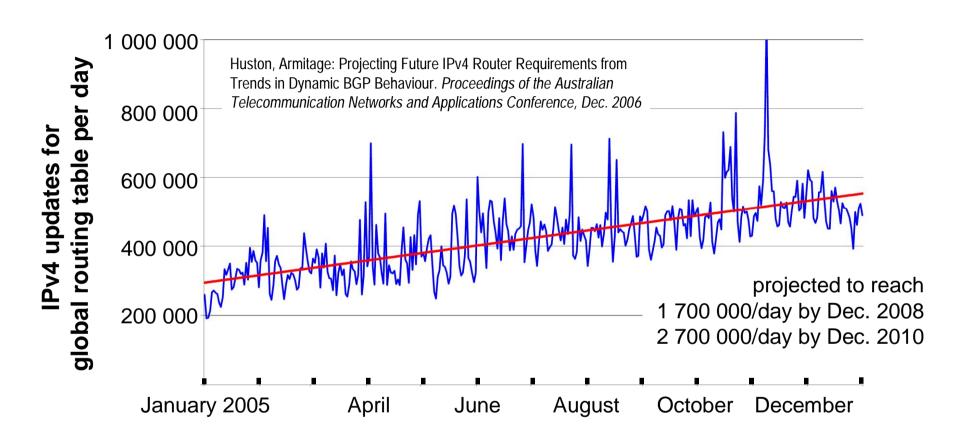

Evidence of Scalability Problem

- Measurements indicate faster-than-linear growth
 - Internet growth combined with increased multi-homing and traffic engineering
 - Predictions for early 2007 were met
- Further growth potential
 - Large IPv6 addressing space
 - Spot market expected to fragmentize IPv4 addressing space

© Ericsson AB 2007 Raimo Vuopionperä 15 Future Internet(working) December 2007

Evidence of Scalability Problem (cont'd)

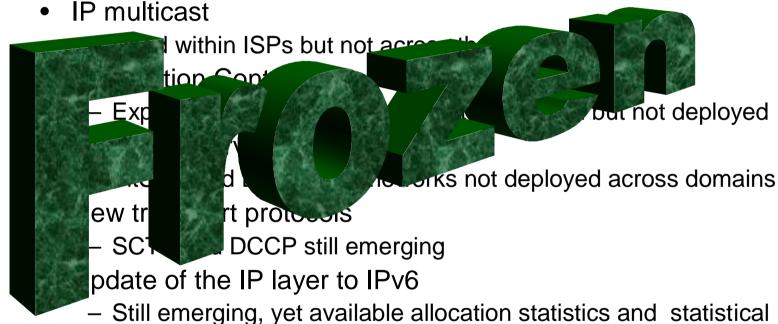

- More frequent router upgrades or replacements expected
 - Memory upgrades to fit growing routing table
 - Processor upgrades to accommodate update frequency growth
- More scalability desired

© Ericsson AB 2007 Raimo Vuopionperä 16 Future Internet(working) December 2007

Problem amplified: Outdated IP layer

Previous attempts to update the Internet

- Still emerging, yet available allocation statistics and statistical analysis of the data indicate that the available IPv4 address pool (at IANA and RIRs level) will run out in 3 years. Btw
- IPSec, BGP-4 made their way to the core

© Ericsson AB 2007 Raimo Vuopionperä 17 Future Internet(working) December 2007

What went wrong with these core protocol updates?

- Did they solve a real problem
 - YES, Absolutely
 - Can their deployment be justified in commercial terms?
 - **Yes**, they have all reasonable use cases and tangible benefits for (wrong) parts of the value chain
 - Observation: those technologies get deployed in the core of the Internet that solve an immediate fatal problem (like BGP-4) or when they offer clear monetary advantage (like IPsec)
 - Conclusion: technologies that benefit the community at large but do not offer immediate return of investment to the party who deploys will only cause extra expenses (inverse of the Reed's).
 Any actor in the value chain can stop or delay the deployment.
- AND it will get worse in the future, ref. M2M.

© Ericsson AB 2007 Raimo Vuopionperä 18 Future Internet(working) December 2007

Mobile control communication areas – M2M

Fun and leisure

- Pervasive gaming
- •Tourism guidance

Logistics

- Cargo tracking
- Route planning
- Stock management

Sales and payment

- Vending machines
- POS terminals
- Advertisements

Industrial

- •Service & maintenance
- Process automation
- Agricultural & forestry
- •Environmental

Home and office

- Remote control of consumer electronics and appliances
- Monitoring
- Security, door access

Convenience

- Lost and found items
- ■Home control
- Shopping
- Location services

Health, Safety&Security

- Health monitoring
- Property monitoring
- Environmental and weather monitoring

Telematics/in-vehicle

- Navigation
- Safety
- Vehicle diagnostics
- Traffic information

© Ericsson AB 2007 Raimo Vuopionperä 19 Future Internet(working) December 2007

→ (More) Key Drivers

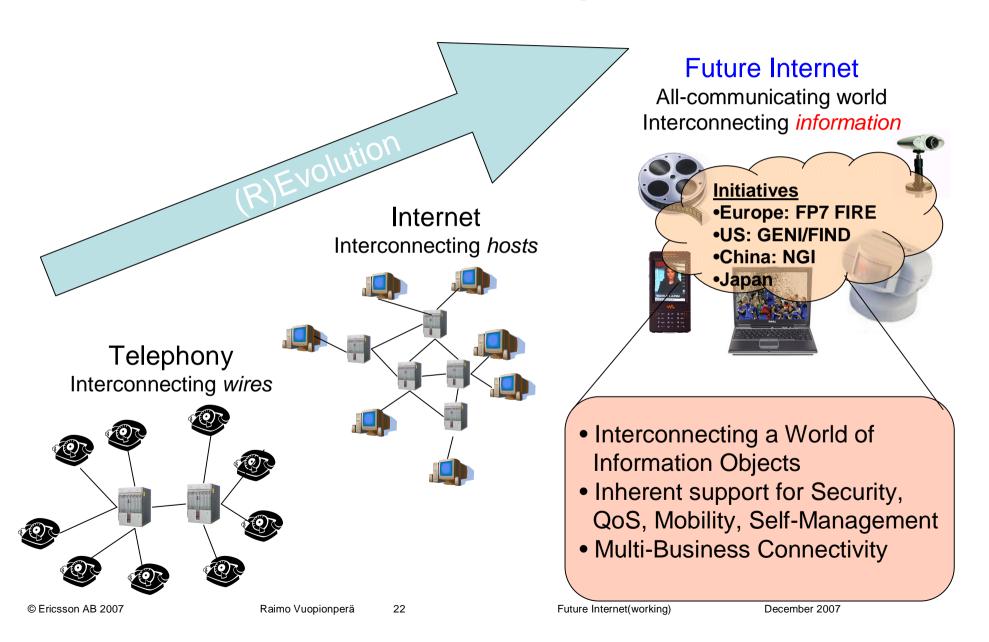

- Mobile phones become multimedia computers needing high bandwidth access to content
- Web 2.0 applications need of always available connectivity to network embedded storage and applications
- Sensor applications broaden the scope of the Internet into physical world
- Voice and data convergence sets new levels for capacity, performance and usability requirements
- New business models are emerging that build on the access independency, global reach, huge existing content, application and developer base of the Internet

© Ericsson AB 2007 Raimo Vuopionperä 20 Future Internet(working) December 2007

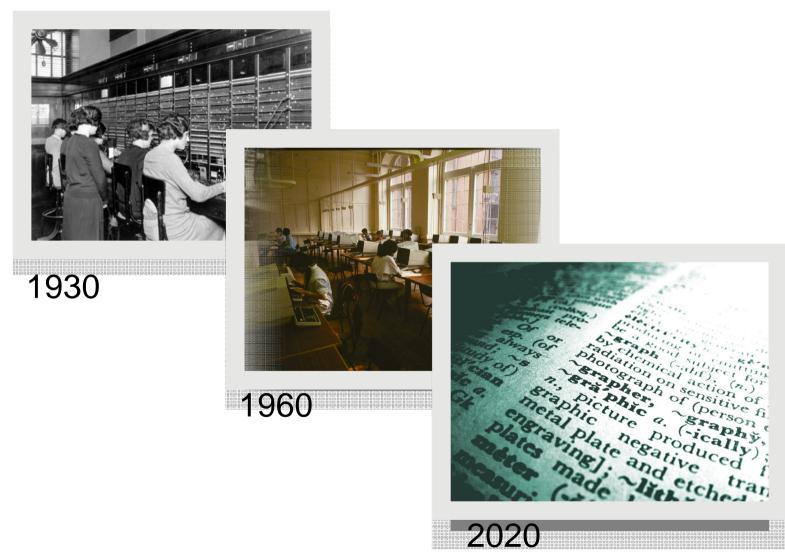

Grand Vision

© Ericsson AB 2007 Raimo Vuopionperä 21 Future Internet(working) December 2007

Grand Vision: Networking of Information

Three waves of networking

© Ericsson AB 2007 Raimo Vuopionperä 23 Future Internet(working) December 2007

First wave: Wires

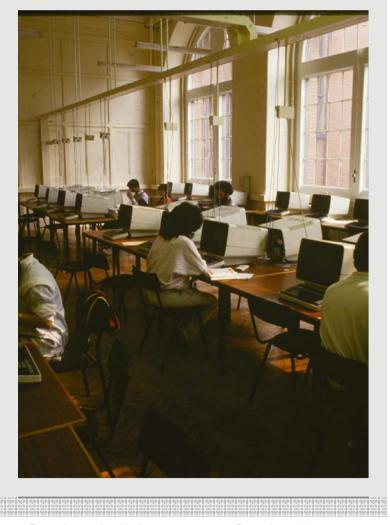

- Connect wires
 - Technically: line interfaces to other line interfaces
- Value creation: wires to every home and office
- Encouraged monopolies

© Ericsson AB 2007 Raimo Vuopionperä 24 Future Internet(working) December 2007

Second wave: Nodes

- Connect users to multiuser hosts
 - Remote access
- Slew of issues, e.g.
 - IP connectivity model
 - Suitability of TCP
- Encouraged distributed operations

© Ericsson AB 2007 Raimo Vuopionperä 25 Future Internet(working) December 2007

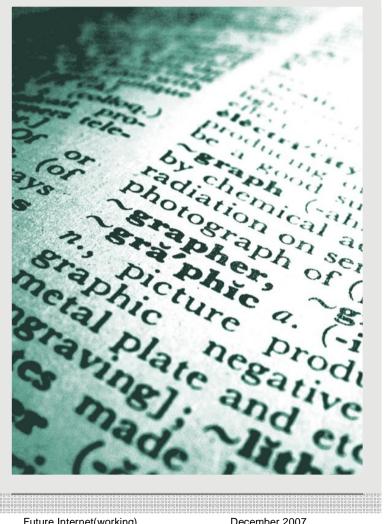

Change of the paradigm

- Intended Killer app of 1980s: Remote access
- Focus on end-points (mainframes/minicomputers)
- Used existing wires, but differently than before
- Un-intended Killer app of 1990's: E-mail, WWW
- Adaptive routing increased reliability exponentially as the number of routers and links grew
 - But then we hit the limits of scalability and business
- No call set up -> high efficiency

© Ericsson AB 2007 Raimo Vuopionperä 26 Future Internet(working) December 2007

Third wave: Information

- Advertised heavily by <u>Van Jacobsen of</u> <u>PARC</u>
 - Build on top of the Internet, like the Internet was built on the top of wires
- Eventually to replace Internet like Internet is now replacing phones...

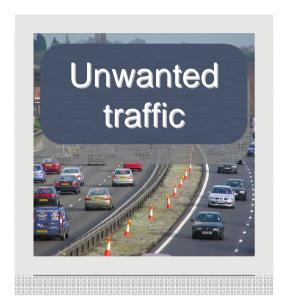

© Ericsson AB 2007 Raimo Vuopionperä 27 Future Internet(working) December 2007

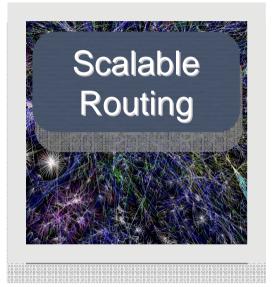

Problems

A closer look

© Ericsson AB 2007 Raimo Vuopionperä 28 Future Internet(working) December 2007

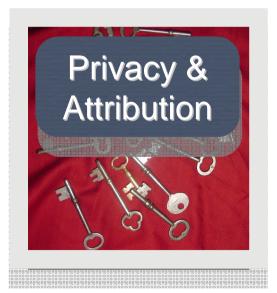

Present problems

© Ericsson AB 2007 Raimo Vuopionperä 29 Future Internet(working) December 2007

SRA defines future challenges

• Information networking

 New concepts of naming, addressing and routing to optimize the access to information

Changing usage patterns

- Create, search and share information
- Maintenance of social networks

Network Socio-economics

 Rules to encourage appropriate behaviour

Autonomy and Resilience

- Configuration agility
- Self healing, self management

Energy Consumption

- Adaptation of the whole stack from the energy constrained network discovery and routing to higher levels
- Shifting Bottlenecks
 - Allocation of work between processing, storage and communication

© Ericsson AB 2007 Raimo Vuopionperä 30 Future Internet(working) December 2007

Unwanted traffic

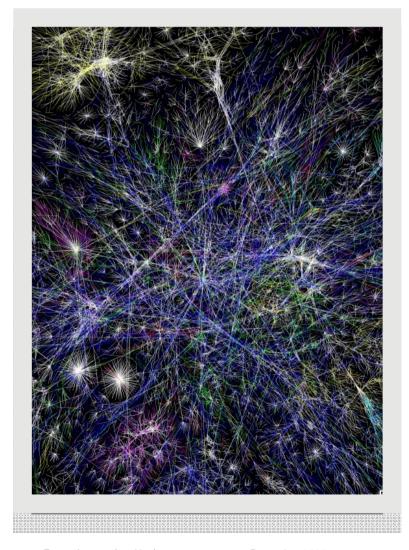

- Spam, DDoS, Phishing,
- Root cause in economics
 - Cost of sending lower than cost of receiving
- Security:
 - Internet was initially designed with a cooperative environment in mind
- The prime example of current, negative externalities
 - An emergent property

© Ericsson AB 2007 Raimo Vuopionperä 31 Future Internet(working) December 2007

Scalability of routing

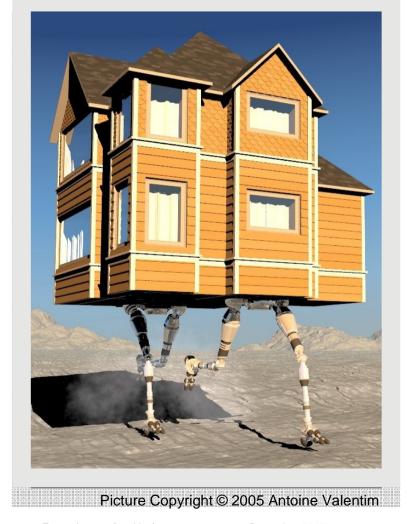

- Traffic engineering, Routing based multihoming, BGP rigidness
- Success of the Internet, Business environment
- IPv6 likely to make worse, not to remedy
- NAT traversal
- Experts disagree on the severity of the problem

© Ericsson AB 2007 Raimo Vuopionperä 32 Future Internet(working) December 2007

Mobility and multi-homing

- Missing indirection
 - IP address has a dual role of node identifier and network locator
 - Point solutions
- HIP: comprehensive, architectural attempt
- Other entities but nodes

© Ericsson AB 2007 Raimo Vuopionperä 33 Future Internet(working) December 2007

Resources and compensation

- Long and short term shortage – moving target
- Resolve congestion through compensation (market arbitration)
- Structure compensation to encourage capacity growth

© Ericsson AB 2007 Raimo Vuopionperä 34 Future Internet(working) December 2007

Trust and reputation

- Original Internet design assumed trusted environment
- Today we secure the channel between source and sink
- But unclear if source and sink are trustworthy?
- We can't build a secure system – need to build on social infrastructures

© Ericsson AB 2007 Raimo Vuopionperä 35 Future Internet(working) December 2007

Privacy and attribution

- Transparent society unattainable
- Need to drive privacy to a basic characteristic of the network
 - Balanced with accountability

© Ericsson AB 2007 Raimo Vuopionperä 36 Future Internet(working) December 2007

Other Fundamental problems in present Internet

© Ericsson AB 2007 Raimo Vuopionperä 37 Future Internet(working) December 2007

Other fundamental problems in present Internet

© Ericsson AB 2007 Raimo Vuopionperä 38 Future Internet(working) December 2007

Governance

- US vs. the rest of the World
- ■IPv4 addresses are running out (really this time)
- IETF vs. ITU-T
- ITU-R (Communications vs. TV industries)

© Ericsson AB 2007 Raimo Vuopionperä 39 Future Internet(working) December 2007

Infrastructure vs. Service provider role

- Operators want:
 - Customers that pay high prices for 'sophisticated services' using few bits
- Customers want:
 - Big cheap bit pipes
 - Fun & Free services

© Ericsson AB 2007 Raimo Vuopionperä 40 Future Internet(working) December 2007

Deployment problems

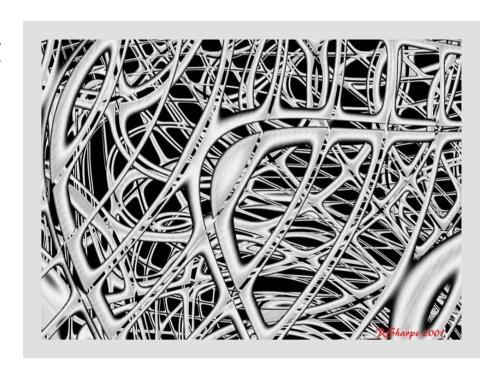

- IPv6
- QoS
- Mobility
- Security
- Combining them ALL?

© Ericsson AB 2007 Raimo Vuopionperä 41 Future Internet(working) December 2007

Configuration & Management complexity

- Opex dominating cost
- Most serious network problems due to configuration mistakes
- Middle boxes, firewalls

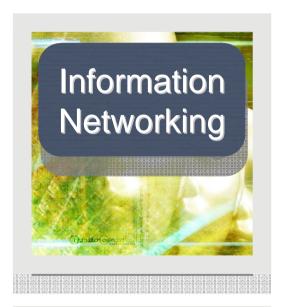

© Ericsson AB 2007 Raimo Vuopionperä 42 Future Internet(working) December 2007

Future Challenges

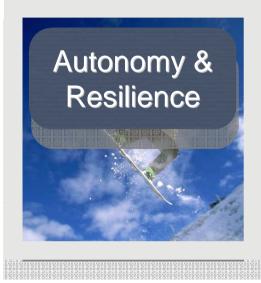

© Ericsson AB 2007 Raimo Vuopionperä 43 Future Internet(working) December 2007

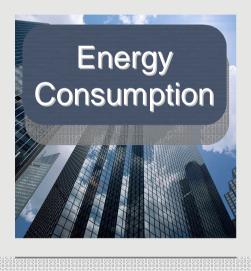

Future challenges

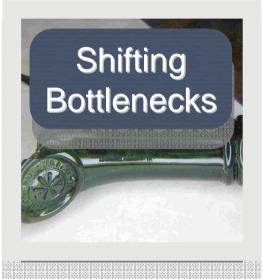

© Ericsson AB 2007 Raimo Vuopionperä 44 Future Internet(working) December 2007

Information networking

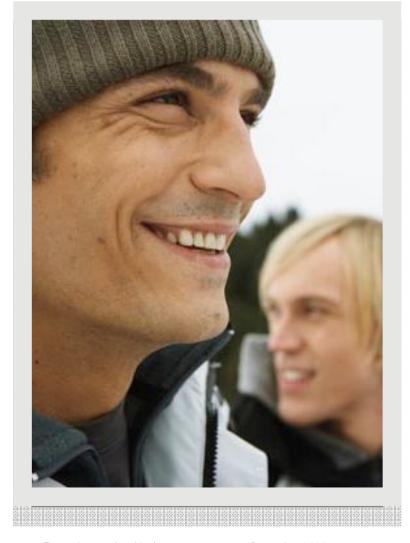

- The third wave of inter-networking
- Rethinking of the architecture
 - Naming, addressing, routing, caching, ...
 - New elements
- Old problems in new disguises

© Ericsson AB 2007 Raimo Vuopionperä 45 Future Internet(working) December 2007

Changing usage patterns

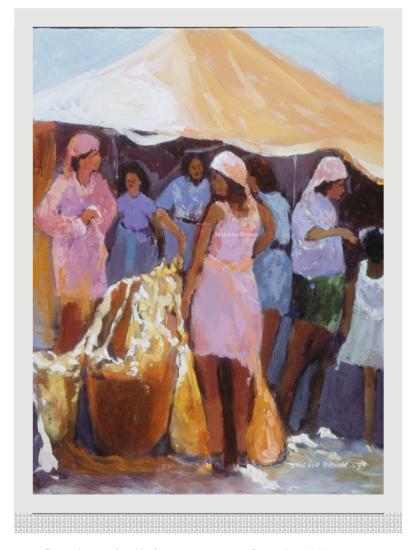

- Complex interactions between behaviour and social structures
- Infrastructure, configur-ability, and practices
- Unpredictable new traffic patterns
- New types of risks & business models

© Ericsson AB 2007 Raimo Vuopionperä 46 Future Internet(working) December 2007

Network socio-economics

- Driven by diminishing transaction costs
- Continuing power battles
- New emerging business opportunities
 - Threats?

© Ericsson AB 2007 Raimo Vuopionperä 47 Future Internet(working) December 2007

Autonomy and resilience

- Configuration agility
 - Zero configuration
 - Auto-management
- Self-optimization
- Organic resilience
 - Ideas from CAS

© Ericsson AB 2007 Raimo Vuopionperä 48 Future Internet(working) December 2007

Energy consumption

- Biggest problem in today's data centers
- Batteries likely to remain a problem
- Cross-layer interactions
- Rethinking radio and inter-networking

© Ericsson AB 2007 Raimo Vuopionperä 49 Future Internet(working) December 2007

Shifting bottlenecks

- Managing flexibility
- Speed of light will remain a problem
 - Consequences: e.g. caching and cache consistency

© Ericsson AB 2007 Raimo Vuopionperä 50 Future Internet(working) December 2007

Research Directions

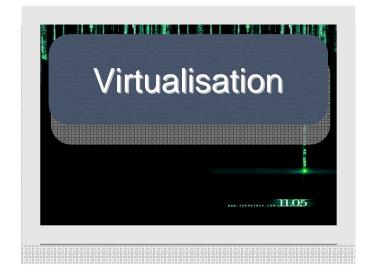

Read:

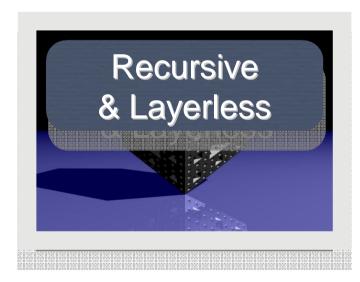

Future Internet Architectures

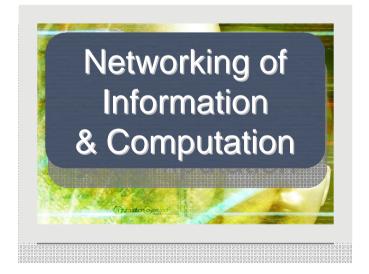

© Ericsson AB 2007 Raimo Vuopionperä 51 Future Internet(working) December 2007

Research Directions

- Medium term: Middle and Overlays
- Long term: Virtualisation, recursive and layerless, Networking of information

© Ericsson AB 2007 Raimo Vuopionperä 52 Future Internet(working) December 2007

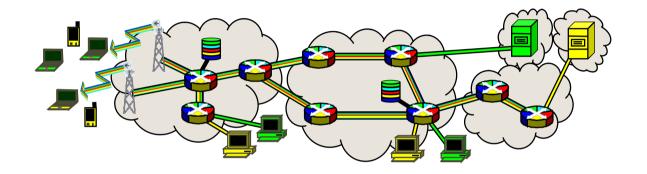

Middle boxes and overlays

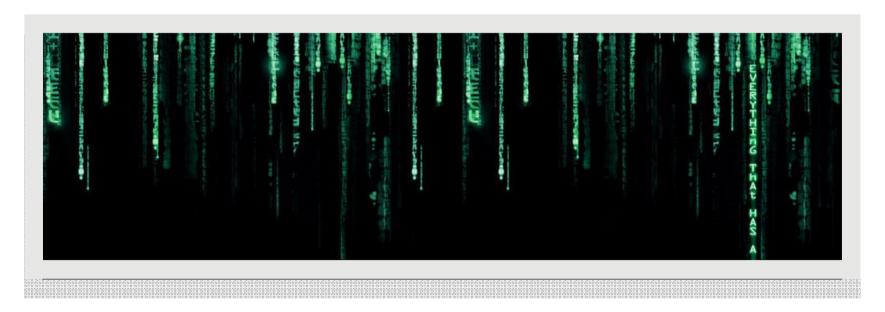

- Main line of research today
- Unlikely to resolve any of the major problems
 - Alleviation possible, of course

© Ericsson AB 2007 Raimo Vuopionperä 53 Future Internet(working) December 2007

Virtualisation

© Ericsson AB 2007 Raimo Vuopionperä 54 Future Internet(working) December 2007

Parallel virtual networks

- Multiple network stacks
 - Easy to install new stacks
- Independent evolution
- Allow contradictory requirements
- Single infrastructure
- Interworking???
- Management of shared resources

© Ericsson AB 2007 Raimo Vuopionperä 55 Future Internet(working) December 2007

Virtualisation vs. the problems

- Unwanted traffic: May help through isolation
- Resources and compensation
 - Provides a new level of granularity; reduces flexibility of resources
- Trust and reputation
 - Isolation may help; Parallel networks may create new problems
- Privacy and attribution: No direct relationship

© Ericsson AB 2007 Raimo Vuopionperä 56 Future Internet(working) December 2007

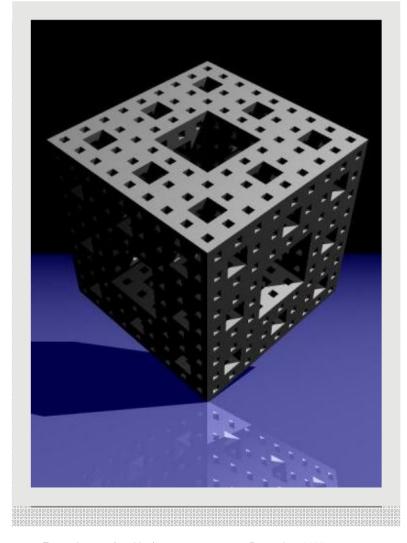

Virtualisation projects

- VINI Virtual Network Infrastructure
- CABO Concurrent Architectures are Better Than One
- Diversified Internet an architecture for
- 4WARD
- GENI

© Ericsson AB 2007 Raimo Vuopionperä 57 Future Internet(working) December 2007

Recursive and Layerless

- One layer with plugable and tuneable mechanisms
- ... or mechanisms / managers that can be plugged together
 - State management,
 End-to-end congestion
 control, Switching /
 forwarding

© Ericsson AB 2007 Raimo Vuopionperä 58 Future Internet(working) December 2007

Layerless & Recursive vs. the problems

- Do not directly affect unwanted traffic, compensation issues, trust and reputation, privacy and attribution
- Adds flexibility, providing
 - better, more optimised services
 - faster evolution of the architecture
- May create completely new security problems
 - e.g. unwanted layer interactions

© Ericsson AB 2007 Raimo Vuopionperä 59 Future Internet(working) December 2007

Recursive and layerless projects

- Layerless
 - Haggle
 - EU FET project
 - Quite large, lots of people involved (about 25)
 - SILO Service Integration, control and Optimisation
- Recursive
 - RNA Recursive Network Architectures
 - 4WARD Stratum concept

© Ericsson AB 2007 Raimo Vuopionperä 60 Future Internet(working) December 2007

Networking of Information

- The major trend...
- Data as first class object
 - Self-certifying data
- Layer "above" internetworking – New internetworking
- Tolerating intermittent connectivity

© Ericsson AB 2007 Raimo Vuopionperä 61 Future Internet(working) December 2007

Fundamental changes

- Hosts are no more important
- May integrate the storage system and the network
- TCP becomes very sub-optimal
 - Not good for real-time person-to-person traffic
 - Not good for non-real-time, cacheable objects
- Routing and addressing needs to be rethought

© Ericsson AB 2007 Raimo Vuopionperä 62 Future Internet(working) December 2007

Relationship to the present problems

- Unwanted traffic
 - Some forms impossible; changes dynamics
- Resources and compensation
 - More important; mandates creation of markets
- Trust and reputation
 - Focus shifts from nodes to information and actors
- Privacy and attribution
 - Changes nature completely, but still a problem
- Mobility & Multihoming
 - Simplified through ID/Locator split

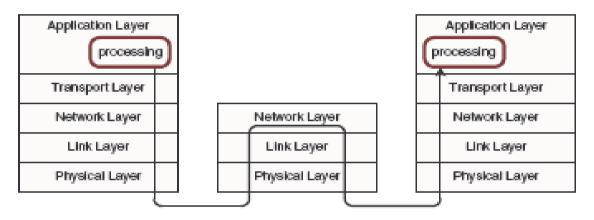

© Ericsson AB 2007 Raimo Vuopionperä 63 Future Internet(working) December 2007

Existing and planned projects

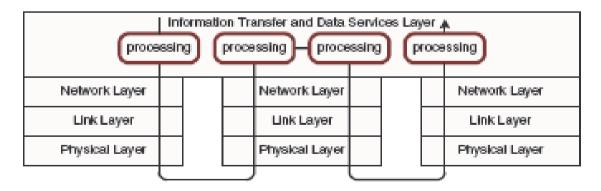

- Content centric networking (Van Jacobsen's)
- Postcards from the Edge
- Data Oriented Network Architecture (DONA)
- Service Centric End-to-End Abstractions
- 4WARD Networking of Information concept
- Publish-Subscribe Internet Routing Paradigm (PSIRP)

© Ericsson AB 2007 Raimo Vuopionperä 64 Future Internet(working) December 2007

Service-Centric End-to-End Abstractions

(a) Layered Internet Architecture

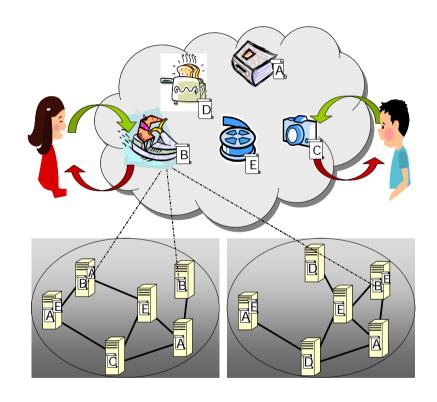

(b) Information Transfer and Data Services Architecture

© Ericsson AB 2007 Raimo Vuopionperä 65 Future Internet(working) December 2007

4WARD Networking of Information

- NetInf Architecture
- Information modelling
- Basic dissemination mechanisms and services
- Non-dissemination and delay-sensitive services
- NetInf evaluation

© Ericsson AB 2007 Raimo Vuopionperä 66 Future Internet(working) December 2007

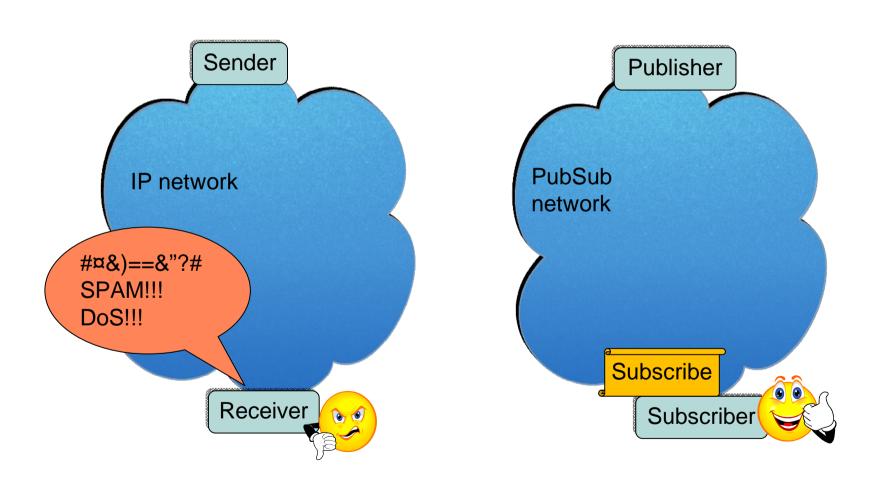

PSIRP: Publish—Subscribe

- Information handles replace IP addresses
 - Identifies a piece of published information
 - No more possible to identify the destination
- Multicast as a basic primitive
 - Multiple subscribers
- Both sender and recipient needed
 - Impossible to send completely unwanted traffic
- Tuple spaces replaces message passing

© Ericsson AB 2007 Raimo Vuopionperä 67 Future Internet(working) December 2007

IP vs. PubSub Internetworking

© Ericsson AB 2007 Raimo Vuopionperä 68 Future Internet(working) December 2007

Basic technical idea

- Publish–subscribe based internetworking
 - Forget IP, send(), receive(), routers, TCP handshake
- Rethink everything, i.e., the whole paradigm
 - Forget Message Passing based IPC
 - Welcome Black board / tuple space based IPC
- Manage data delivery
 - Rendezvous: rendezvous near sender, not receiver
 - Routing: build a (sub-optimal) route
 - Forwarding: efficient data delivery

© Ericsson AB 2007 Raimo Vuopionperä 69 Future Internet(working) December 2007

Basic technical idea

- Publish–subscribe based internetworking
 - Forget Internet Protocol packet formats
 - Forget send() and receive() socket calls
 - and everything based on them, i.e., the whole API
 - Forget routers and forwarding as we know them
 - Forget TCP three-way handshake
 - Forget network management as we know it
- Rethink everything, i.e., the whole paradigm
 - Forget Message Passing based IPC
 - Welcome Black board / tuple space based IPC
- Going deeper: not so different after all
 - Changes mostly APIs, naming and rendezvous
 - Results in large changes to the network economics
 - Allows (but not necessitates) rethinking everything

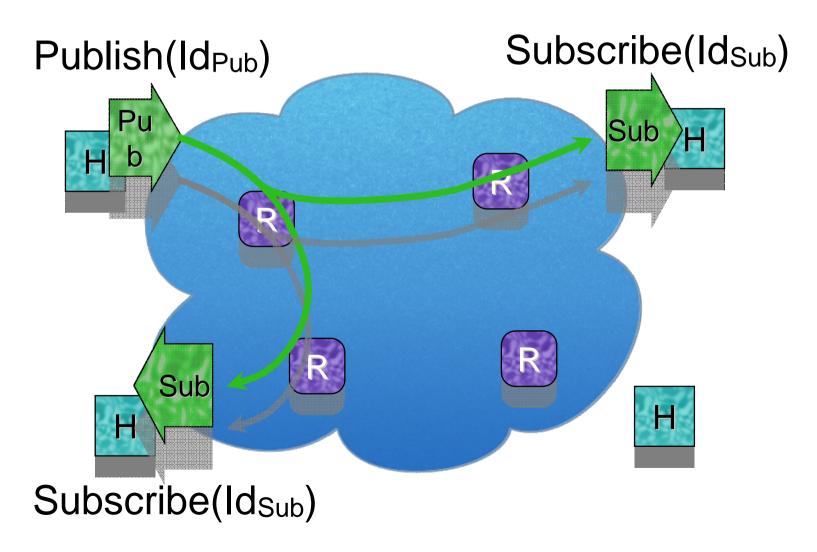

© Ericsson AB 2007 Raimo Vuopionperä 70 Future Internet(working) December 2007

Why?

- Micro-economics: Prevents DDoS very effectively
 - sender does have incentive to send, always
 - receiver does not necessarily have incentive to receive
 - current networks help the sender
 - network forwards whatever senders send
 - "rendezvous" takes place at the receiver, with the receiver's resources
 - from fundamentals: how would the network help receiver?
 - by allowing receiver to select what to receive
- Architecture: Unifies unicast and multicast
 - unicast becomes a 1-recipient multicast
 - makes radio and wireline more similar
- Applications: More natural to many applications
 - content delivery networks

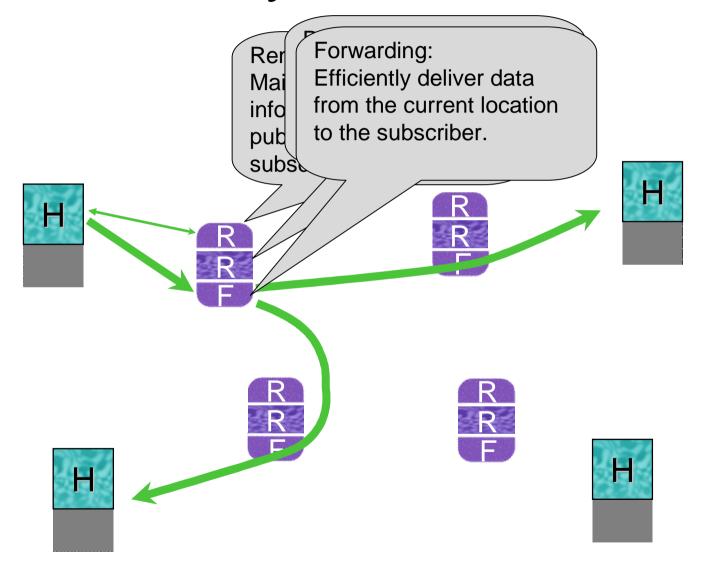

© Ericsson AB 2007 Raimo Vuopionperä 71 Future Internet(working) December 2007

Functional model

© Ericsson AB 2007 Raimo Vuopionperä 72 Future Internet(working) December 2007

Three-layer architecture

© Ericsson AB 2007 Raimo Vuopionperä 73 Future Internet(working) December 2007

Summary

© Ericsson AB 2007 Raimo Vuopionperä 74 Future Internet(working) December 2007

Summary

- Internet is a critical backbone of the society!!!
 - Internetworking is needed also in future!
- Internet has grown out from its original design specifications
 - We need to address the problems so that we dont need to invent patches over patches over ...
 - NOTE: the core of the Internet hasn't changed in a > decade!
- Not only the problems of the current Internet are needed to consider.
 - Many Socio-economical, business, ... are putting pressure on getting Next Generation InterNetworking solved in satisfactory manner.
- There exist many efforts to address the "problems"
- ... but one should also remember that it takes time and we must find ways to preserve the current internet until the new Future Internet is in place and serving us all! ©

© Ericsson AB 2007 Raimo Vuopionperä 75 Future Internet(working) December 2007

Thank you!

© Ericsson AB 2007 Raimo Vuopionperä 76 Future Internet(working) December 2007

Questions?

© Ericsson AB 2007 Raimo Vuopionperä 77 Future Internet(working) December 2007
